Risk Assessment A risk assessment of all hazardous tasks is required under legislation. A risk assessment is an essential element that should be conducted before the commencement of work, to identify and eliminate the risk of falls and other risks, or to minimise these risks by implementing control measures. This does not need to be a complicated process it is a matter of assessing the job to be done and considering what actions are necessary so the person doing the job does not injure themselves. This should be considered in terms of What are the chances of an incident occurring. What could the possible consequences be. What can be done to reduce, or better still, eliminate the risk. Some points to consider when working on or in a roof What is the best and safest access to the roof and working areas. What condition is the roof in. Should the roof structure and surface be checked. Does the worker have appropriate footwear. Are all ladders, tools and equipment suitable and in good condition. Where ladders are to be used, is there a firm, stable base for them to stand on. Can they be tied or secured in some way at the top. Is there a roof anchor to attach a harness and lanyard to. If so, instruction should be issued for the use of an approved harness or only suitably trained people used. Are all tools and materials being used, prevented from slipping and falling onto a person at ground level. Is the area below the work area suitably protected to prevent people entering this area. Is there a system which prevents employees from working on or in roofs if they are unwell or under the influence of drugs or alcohol. Are there any special conditions to consider i.e. excessive roof pitch, limited ground area, fragile roof, electrical power lines. Other Important Requirements THIS HEATER TO BE INSTALLED BY AN AUTHORISED PERSON ONLY DO NOT

Operate this appliance before reading the instruction booklet. DO NOT Place articles on or against this appliance. <http://mini-garden.ru/userfiles/file/cp300-manual.xml>

DO NOT Use or store flammable materials near this appliance. DO NOT Operate this appliance with the front cover removed. 3 Introduction and Specs 2 INTRODUCTION These installation instructions cover the installation of Braemar WF2000 series gas wall furnaces. Failure to comply with these requirements may void the warranty. A data plate fixed to the heater details both the model number and gas type. HEATER PREPARATION Check markings on carton to confirm that heater supplied is as required. With the unit laying on its back remove the top carton and liner. Remove the protective plastic film and discard. Remove the front cover by removing the 2 cover retaining screws above the top louvre inside the air outlet, and the 2 cover transit screws from the back of the cover top panel. If a rear register is to be installed with the heater, fit the required components to the back of the heater at this point instructions are included in the Rear register kit. HEATER LOCATION When selecting a location for the wall furnace, the following points must be considered Avoid corners, as this can lead to poor heated air distribution. Locate wall studs for an inbuilt installation the stud spacing measured from inside to inside must be 405 and 430mm a false stud must be fitted if the spacing is greater than 430mm an alternative location must be selected if the spacing is less than 405mm. Ensure that roof timbers will not obstruct the flue and that clearances of 10mm from twin wall metal flue and 25mm from single wall metal flue can be maintained from combustible materials. Ensure that concealed piping or wiring within the wall cavity will not obstruct the installation. If a rear register is to be fitted, select a location to ensure that wall studs do not obstruct the rear register. Do not obstruct the air outlet, or the rear register, with furniture as this can lead to poor heated air distribution. Do not face the heater across a room along the room is better.

Maintain a clearance of at least 300mm from both sides of the heater, at least 400mm above the heater, and mm from the floor. GAS SUPPLY The gas connection point is on the lower right hand side of the heater. Gas supply piping should be sized in accordance with pipe sizing guidelines given in AS5601 Gas Installations. The gas supply can be routed from below, above or behind the heater. 280 POOR GOOD CEILING 400mm minimum ELECTRICITY SUPPLY GOOD FLOOR mm The electricity supply must be a 240Vac 50Hz earthed power outlet with switch. It must be located within 900mm from the left of the heater or within 400mm from the right of the heater. ILL2002 FLUE SYSTEM The flue system must be installed in accordance with AS5601 Gas Installations and local building regulations. The flue must be an approved twin wall metal flue within a wall cavity. Single wall metal flue may be used within a ceiling space provided AS5601 specified clearances from combustible materials are maintained and access is possible for inspection and servicing. If the heater is replacing an existing unit it must be confirmed that the flue system complies with current requirements of AS5601. The flue must be terminated outside it must not be terminated in a roof space. Wall, Cupboard, Bookcase etc minimum minimum 300mm minimum distance between objects Wall, Cupboard, Bookcase etc. 5 Inbuilt Heater Installation 4 CHECK Select a suitable location between wall studs complying with requirements set out on page 3 of this manual. Fit top and bottom mounting brackets as shown brackets and mounting screws are included with the heater. Install the flue system in accordance with instructions contained in the flue kit. If a rear register is required, fit the components in accordance with instructions contained in the rear register kit before fitting the heater into the wall ENSURE THAT A SUITABLE VENTILATION OPENING IS PROVIDED AS SPECIFIED IN THE REAR REGISTER KIT.

<http://www.bouwdata.net/evenement/3uz-fe-manual-transmission>

Fit the heater onto the mounting brackets by sliding the flue spigot at the top of the heater up through the top mounting bracket, push into wall cavity at bottom and lower onto bottom mounting brackets ENSURE THAT THE HEATER IS RESTING ON BOTH BOTTOM MOUNTING BRACKETS. Select a suitable location between wall studs complying with requirements set out on page 3 of this

manual. Fit the heater onto the mounting brackets by sliding the flue spigot at the top of the heater up through the top mounting bracket, push into wall at bottom and lower onto bottom mounting brackets ENSURE THAT THE HEATER IS RESTING ON BOTH BOTTOM MOUNTING BRACKETS. Screw side flange of heater to bottom mounting bracket at each side to secure heater. The Braemar WF2000 wall furnace is NOT suitable for replacement of fully recessed wall furnaces that are installed into a double brick wall. INSTALLATION Remove the existing wall furnace. Remove the existing mounting brackets. Fit the Braemar mounting brackets supplied with the heater as per the dimensions given on page 4 or 5 of this manual. Complete the heater installation as per a new installation. The following table details kits that are available to assist in replacing an existing wall furnace and identifies kit requirements for MOST common replacements. Fit the flue adaptor into the bottom of the existing flue before fitting the Braemar top mounting bracket. The location of the top and bottom mounting brackets must comply with details given on page 4 or 5 of this manual. Remove and discard the liner from the flue adaptor. Fit the flue adaptor onto the flue extension. Fit the flue adaptor and flue extension into the bottom of the existing flue before fitting the Braemar top mounting bracket. Trim the flue extension to length if required. Must be fitted over spigot on Braemar top mounting bracket. Fit the infill panel after the heater is fitted onto the mounting brackets as shown below.

<http://hakanacaroglu.com/images/702-sound-devices-manual.pdf>

Attach the infill panel to the wall using screws to suit the wall type screws to suit plaster board, timber or masonry walls are supplied in the infill panel kit. Fit the screws through the snapcap base. Clip the snapcap cover to the base after fitting the screws to cover the screw heads. Check for and rectify any gas leaks in accordance with AS5601 Gas Installations prior to any further commissioning. Connect the 3pin plug to a suitable 240Vac 50Hz power outlet. FIT THE THERMOSTAT BRACKET Carefully uncoil enough of the thermostat bulb capillary line to enable the thermostat bracket to be fitted to the wall approximately 50mm below the bottom of the heater. Screw the thermostat bracket to the wall or skirting board 50mm below the bottom of the heater with the thermostat bulb horizontal and in line with the heater centreline. Thermostat capillary Wall opening Skirting board Floor Thermostat bulb bracket SET THE GAS PRESSURE NATURAL GAS MODELS Remove the burner pressure testpoint screw and connect manometer UPPER TEST POINT ON LEFT HAND SIDE OF GAS VALVE. Set the gas control to 7. Check burner pressure at burner pressure test point adjust to 0.90 kpa if required using regulator adjustment on right had side of gas valve. REGULATOR ADJUSTMENT SCREW CLOCKWISE Increase pressure ANTICLOCKWISE Decrease pressure CHECK PILOT OPERATION With the pilot only running check that the pilot flame is approximately as shown below. It may be necessary to increase or decrease the pilot rate to suit different supply pressure areas. 16 PILOT ADJUSTMENT SCREW CLOCKWISE Decrease ANTICLOCKWISE Increase NORMAL PILOT FLAME CHECK ROOM FAN OPERATION Light the pilot and main burner and set the control to 7. Set the fan switch to Auto. The fan should start on low approximately 12 minutes after the main burner is ignited. Allow the unit to warm up and check that the fan increases to its normal speed. This may take a few minutes the actual time will depend on room temperature.

<http://energysatrap.com/images/7015-r50-manual.pdf>

Switch the fan to boost and check that the fan speed increases. Turn the gas control back to the pilot position. SET THE AIR OUTLET SIDEWAYS ADJUSTMENT VANES Vertical vanes are fitted inside the air outlet at the bottom of the heater. These allow the sideways spread of the heated air jet to be adjusted to suit each installation. Adjust the vanes to take account of room shape, furniture positions, and normally occupied zones of the room. FIT THE FRONT COVER Stand the cover on the right had side of the heater and CONNECT THE EARTH LEAD FROM THE COVER TO THE TAB AT THE TOP RIGHT HAND SIDE OF THE HEATER. Hook the rear edge of the front cover top panel

over the top of the heater so that the notches engage on the serrations on each side of the heater TAKE CARE NOT TO DISLodge THE EARTH LEAD. Push the cover in at the bottom to engage over the air outlet and push back against the wall. Main burner will not ignite. Cannot achieve specified test point pressure. Room fan does not start. Fan will not switch from low to normal. Fan noisy. Heater turns off before room warms up. Objectionable odour when heater is running see note below. POSSIBLE CAUSES Air in gas line. Blockage in gas line. Insufficient gas supply pressure. No spark. Insufficient gas supply pressure. Low pilot flame. Insufficient gas supply pressure. No electricity supply. Wiring dislodged. Room fan pushed in and jammed during transport. Test point pressure too low. Boost selected at manual fan switch. Control set too low. Thermostat bulb too close to bottom of heater. Hot air recirculation. Flue cowl pushed on too far. Flue cowl too close to roof. REMEDY Purge gas line. Check supply pressure at gas valve inlet pressure test point increase supply pressure to specified value with main burner running Natural Gas 1.13 kpa Propane 2.75 kpa Check ignition lead is connected and not damaged. Check room fan is free to rotate. Gently pull motor forwards to clear fan wheel from internal rear panels if necessary.

Check test point pressure adjust if necessary see Specifications. Select Auto at manual fan switch. Increase setting on control. Relocate thermostat bulb bracket see Commissioning. Check for air leakage from rear register components if fitted. Check flue cowl installation refit correctly if necessary. Check flue cowl location must be at least 500mm from roof. Note Some odour from a new heater is normal this will generally disappear after a few hours of operation at maximum gas rate. 15 SERVICE TECHNICAL SUPPORT Seeley International Pty Ltd has a policy of continuous product development and therefore reserves the right to make changes to these specifications without notice. Ask an Expert Home Improvement Questions HVAC Questions I have a WF2000 gas wall furnace. Installed July 2011. I have a WF2000 gas wall furnace. We have just

started using again this season. The pilot light is difficult to ignite using manual procedures. The heater goes out at various stages. We have rung for service, but cannot have any attend till Thursday next week. As temperatures are minus Goulburn NSW of a morning I would like some action now. Submitted 8 years ago. Industrial Verified Phil All work to be done by licensed professional. WE KEEP GOING UNTIL YOU HAVE THE INFORMATION YOU NEED, I come and go. This is step ONE. Phil Hello. Welcome to Just Answer. I see you have been waiting for a while. Phil Phil This unit shows that it has electronic ignition. I can't see it from here of course. But if that's not working and you are having to light it by hand, and it only stays lit intermittently, then the problem is with the flame sensor most likely. Phil It may well be under its first year warranty.

Phil If you are good with fixing such things, you can examine the pilot flame impingement on the flame sensor rod, and use plumbers sand cloth to clean off the flame sensor rod. Phil If you are unable to determine any of these things easily it will best to wait for service and by one or two cheap free standing electric space heaters to take the chill off in the meantime. Phil oops buy one Phil I meant to type Customer Is under warranty, thank you. thank you, XXXXX XXXXX I will wait Phil That's a good idea, Phil Phil Customer It is a mechanical pilot lighter, one has to hold a button down whilst, you click the ignition. When and if it fires we have to hold the button down for 20 seconds. It sometimes works, but often have to try many times. Customer Not electronic ignition. Customer It is not electronic ignition. I think I will wait as it is under warranty. Industrial Verified Phil and 87 other HVAC Specialists are ready to help you Ask your own question now Was this answer helpful. That is not the problem. The furnace will kick on for a few minutes then shut off. The fan will not even turn Lennox furnace will not turn on. The fan will not even turn on from thermo. No ice on any pipes. Everything has power. Upon looking inside noticed control panel lights. Top one labeled speed. We are now getting heat irregularly. An integral Coleman air conditioner was added in the summer of 2011, including a larger blower assembly. I have an old Day and Night gas furnace heater in my house. It has been working fine for 20 years. Twice within a week, I heard a loud boom when the furnace was in use. Pilot is out, trying to start it. Its Model is YCX042G1M0AA, I have a Trane XL1200 single package heater. Sometimes it just blows cold air. I installed a dual fuel furnace. After it I have a Coleman Evcon heater model DGAT075DBE. After it goes off when the correct temperature is reached. It sometimes won't come on again.
